My topic for my html page is application for USC school. There are 4 forms in total and only one form will be showed at one time.

In the first form, the user can enter his/her name, select his residency and country, specify his/her gender, birth date and ethnicity. All these information will be validated and then stored. In the second form, the user offer application information such as the semester, school in USC, and program. If the user has attended USC previous, he/she can also offer previous program information. The user is also required to offer undergraduate GPA, so that we know about his/her academic background.

The first report is shown when every time all application information has been validated and stored. Each line will tell the user previous or latest application is finished with a button. With the button the user can see details about all information he has offered.

All required information in form1 to go into form2: name, residency, country, gender, birthday, and ethnicity. All required information in form2 to finish application: semester to apply, school to apply, program to apply, undergraduate GPA information.
